

# Dampers and Louvres

## Dampers

The 100 mm pitch damper is made entirely of aluminium profiles with nylon accessories.

The blades of the damper are controlled by concealed nylon gears.

The damper is light, as it is made of aluminium and yet extremely strong because of its carefully-engineered design. The blades can be controlled by one or two shafts by hand or with an actuator.

The damper's seal is enhanced by gaskets inserted in the blades and the frame.

Dampers can be supplied in any height or any width and, being manufactured entirely from aluminium and nylon, are completely rust proof.

## Louvres

The 85 mm pitch louvre is made entirely of aluminium profiles with nylon accessories.

The louvre is light, as it is made of aluminium and yet extremely strong because of its carefully-engineered design.

Louvres can be supplied in any height or any width and, being manufactured entirely from aluminium and nylon, are completely rust proof.
